

AMIS-42670

High-Speed CAN Transceiver for Long Networks

Description

The AMIS-42670 CAN transceiver is the interface between a controller area network (CAN) protocol controller and the physical bus and may be used in both 12 V and 24 V systems. The transceiver provides differential transmit capability to the bus and differential receive capability to the CAN controller. Due to the wide common-mode voltage range of the receiver inputs, the AMIS-42670 is able to reach outstanding levels of electromagnetic susceptibility (EMS). Similarly, extremely low electromagnetic emission (EME) is achieved by the excellent matching of the output signals.

The AMIS-42670 is the industrial version of the AMIS-30660 and primarily intended for applications where long network lengths are mandatory. Examples are elevators, in-building networks, process control and trains. To cope with the long bus delay the communication speed needs to be low. AMIS-42670 allows low transmit data rates down to 10 kbit/s or lower.

Features

- Fully Compatible with the ISO 11898-2 Standard
- Certified “Authentication on CAN Transceiver Conformance (d1.1)”
- Wide Range of Bus Communication Speed (0 Mbit/s up to 1 Mbit/s)
- Allows Low Transmit Data Rate in Networks Exceeding 1 km
- Ideally Suited for 12 V and 24 V Industrial and Automotive Applications
- Low Electromagnetic Emission (EME) Common-Mode Choke is No Longer Required
- Differential Receiver with Wide Common-Mode Range (± 35 V) for High EMS
- No Disturbance of the Bus Lines with an Unpowered Node
- Thermal Protection
- Bus Pins Protected Against Transients
- Silent Mode in which the Transmitter is Disabled
- Short Circuit Proof to Supply Voltage and Ground
- Logic Level Inputs Compatible with 3.3 V Devices
- These are Pb-Free Devices*

FUNCTIONAL DESCRIPTION

Operating Modes

The behavior of AMIS-42670 under various conditions is illustrated in Table 3 below. In case the device is powered, one of two operating modes can be selected through Pin S.

Table 5. FUNCTIONAL TABLE OF AMIS-42670; x = don't care

|--------------------------------|--------------------|--------------------|-----------------------|-----------------------|-----------|---------|

| 4.75 V to 5.25 V | x | 1 | $V_{CC}/2$ | $V_{CC}/2$ | Recessive | 1 |
| 4.75 V to 5.25 V | 1 (or Floating) | X | $V_{CC}/2$ | $V_{CC}/2$ | Recessive | 1 |
| $V_{CC} < PORL$ (Unpowered) | x | X | $0 V < CANH < V_{CC}$ | $0 V < CANL < V_{CC}$ | Recessive | 1 |
| $PORL < V_{CC} < 4.75 V$ | $> 2 V$ | X | $0 V < CANH < V_{CC}$ | $0 V < CANL < V_{CC}$ | Recessive | 1 |

High-Speed Mode

If Pin S is pulled low (or left floating), the transceiver is in its high-speed mode and is able to communicate via the bus lines. The signals are transmitted and received to the CAN controller via the Pins TxD and RxD. The slopes on the bus line outputs are optimized to give extremely low electromagnetic emissions.

Silent Mode

In silent mode, the transmitter is disabled. All other IC functions continue to operate. The silent mode is selected by connecting Pin S to V_{CC} and can be used to prevent network communication from being blocked, due to a CAN controller which is out of control.

Over-temperature Detection

A thermal protection circuit protects the IC from damage by switching off the transmitter if the junction temperature exceeds a value of approximately 160°C. Because the transmitter dissipates most of the power, the power dissipation and temperature of the IC is reduced. All other

IC functions continue to operate. The transmitter off-state resets when Pin TxD goes high. The thermal protection circuit is particularly necessary when a bus line short-circuits.

High Communication Speed Range

The transceiver is primarily intended for industrial applications. It allows very low baud rates needed for long bus length applications. But also high speed communication is possible up to 1 Mbit/s.

Fail-Safe Features

A current-limiting circuit protects the transmitter output stage from damage caused by an accidental short-circuit to either positive or negative supply voltage, although power dissipation increases during this fault condition.

The pins CANH and CANL are protected from automotive electrical transients (according to "ISO 7637"; see Figure 3). Pin TxD is pulled high internally should the input become disconnected.

ELECTRICAL CHARACTERISTICS

Definitions

All voltages are referenced to GND (Pin 2). Positive currents flow into the IC. Sinking current means the current is flowing into the pin; sourcing current means the current is flowing out of the pin.
