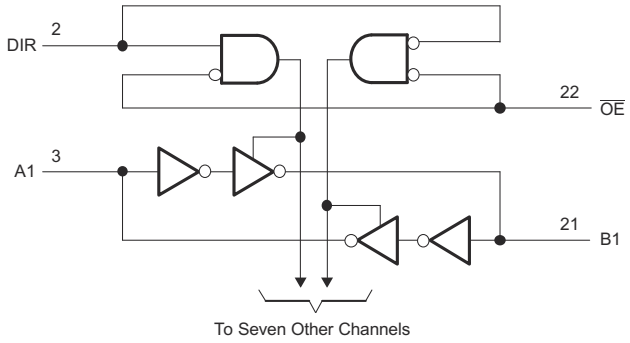
SN74LVCH8T245 8-BIT Dual-Supply Bus Transceiver With Configurable Level-Shifting, Voltage Translation, and 3-State Outputs

1 Features

- Control inputs (DIR and $\overline{OE}$) V_{IH} and V_{IL} levels are referenced to V_{CCA}
- Bus hold on data inputs eliminates the need for external pullup and pulldown resistors
- V_{CC} isolation
- Fully configurable dual-rail design
- I_{off} supports Partial-Power-Down node operation
- Latch-up performance exceeds 100 mA per JESD 78, class II
- ESD protection exceeds JESD 22

2 Applications

- Personal electronics
- Industrial
- Enterprise
- Telecommunications



Logic Diagram (Positive Logic)

3 Description

The SN74LVCH8T245 is an 8-bit noninverting bus transceiver that uses two separate configurable power-supply rails. The A port is designed to track V_{CCA}, which accepts any supply voltage from 1.65 V to 5.5 V. The B port is designed to track V_{CCB}, which also accepts any supply voltage from 1.65 V to 5.5 V. This allows for universal low-voltage bidirectional translation between any of the 1.8-V, 2.5-V, 3.3-V, and 5.5-V voltage nodes.

The SN74LVCH8T245 is designed for asynchronous communication between two data buses. The logic levels of the direction-control (DIR) input and the output-enable ($\overline{OE}$) input activate either the B-port outputs, the A-port outputs, or place both output ports into a high-impedance state. The device transmits data from the A bus to the B bus when the B-port outputs are activated, and from the B bus to the A bus when the A-port outputs are activated. The input circuitry on both A and B ports are always active.

Active bus-hold circuitry holds unused or undriven inputs at a valid logic state. Use of pullup or pulldown resistors with the bus-hold circuitry is not recommended. This device is fully specified for partial-power-down applications using I_{off}. The I_{off} circuitry disables the outputs, preventing damaging current backflow through the device. The V_{CC} isolation feature ensures that if either V_{CCA} or V_{CCB} is at GND, then the outputs are in the high-impedance state. To ensure the high-impedance state during power up or power down, $\overline{OE}$ should be tied to V_{CCA} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

The SN74LVCH8T245 is designed so that the control pins (DIR and $\overline{OE}$) are referenced to V_{CCA}.

Package Information(1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
SN74LVCH8T245	DB (SSOP, 24)	8.65 mm × 3.90 mm
	DGV (TVSOP, 24)	5.00 mm × 4.40 mm
	PW (TSSOP, 24)	7.80 mm × 4.40 mm
	RHL (VQFN, 24)	5.50 mm × 3.50 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Table of Contents

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision B (January 2016) to Revision C (December 2022)	Page
• Updated the numbering format for tables, figures, and cross-references throughout the document	1
• Updated thermals for PW package	5
• Removed the *Supports High-Speed Translation* and added the *Balanced High-Drive CMOS Push-Pull Outputs* section	13

Changes from Revision A (February 2007) to Revision B (January 2016)	Page
• Added *ESD Ratings* table, *Feature Description* section, *Device Functional Modes*, *Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section	1

5 Pin Configuration and Functions

B7	15	15	I/O	Input/output B7. Referenced to V_{CCB}.
B8	14	14	I/O	Input/output B8. Referenced to V_{CCB}.
DIR	2	2	I	Direction-control signal. Referenced to V_{CCA}.
$\overline{OE}$	22	22	I	3-state output-mode enables. Pull $\overline{OE}$ high to place all outputs in 3-state mode. Referenced to V_{CCA}.
V_{CCA}	1	1	—	A-port supply voltage. 1.65 V ≤ V_{CCA} ≤ 5.5 V
V_{CCB}	23, 24	23, 24	—	B-port supply voltage. 1.65 V ≤ V_{CCA} ≤ 5.5 V
GND	11, 12, 13	11, 12, 13	—	Ground

(1) I = input, O = output

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

		MIN	MAX	UNIT
Supply voltage	V_{CCA} and V_{CCB}	–0.5	6.5	V
Input voltage(2)	I/O ports (A port)	–0.5	6.5	V
	I/O ports (B port)	–0.5	6.5	
	Control inputs	–0.5	6.5	
Voltage range applied to any output in the high-impedance or power-off state(2)	A port	–0.5	6.5	V
	B port	–0.5	6.5	
Voltage range applied to any output in the high or low state(2) (3)	A port	–0.5	V_{CCA} + 0.5	V
	B port	–0.5	V_{CCB} + 0.5	
Input clamp current	V_I < 0		–50	mA
Output clamp current	V_O < 0		–50	mA
Continuous output current, I_O			±50	mA
Continuous through current	V_{CCA}, V_{CCB}, and GND		±100	mA
Junction temperature, T_J		–40	150	°C
Storage temperature, T_{stg}		–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Section 6.3*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) The input and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.
(3) The output positive-voltage rating may be exceeded up to 6.5 V maximum if the output current rating is observed.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±4000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101(2)	±1000	
		Machine model (MM)	±200	

(1) JEDEC document JEP155 states that 500 V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250 V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)(1) (2) (3)

				MIN	MAX	UNIT
V_{CCA}	Supply voltage			1.65	5.5	V
V_{CCB}				1.65	5.5	
V_{IH}	High-level input voltage(1)	Data inputs(4)	V_{CCI} = 1.65 V to 4.5 V	V_{CCI} × 0.65		V
			V_{CCI} = 2.3 V to 2.7 V	1.7		
			V_{CCI} = 3 V to 3.6 V	2		
			V_{CCI} = 4.5 V to 5.5 V	V_{CCI} × 0.7		
V_{IL}	Low-level input voltage(1)	Data inputs(4)	V_{CCI} = 1.65 V to 4.5 V		V_{CCI} × 0.35	V
			V_{CCI} = 2.3 V to 2.7 V		0.7	
			V_{CCI} = 3 V to 3.6 V		0.8	
			V_{CCI} = 4.5 V to 5.5 V		V_{CCI} × 0.3	

6.3 Recommended Operating Conditions (continued)

over operating free-air temperature range (unless otherwise noted)(1) (2) (3)

				MIN	MAX	UNIT
V_{IH}	High-level input voltage	Control inputs (referenced to V_{CCA})(5)	V_{CCI} = 1.65 V to 4.5 V	V_{CCA} × 0.65		V
			V_{CCI} = 2.3 V to 2.7 V	1.7		
			V_{CCI} = 3 V to 3.6 V	2		
			V_{CCI} = 4.5 V to 5.5 V	V_{CCA} × 0.7		
V_{IL}	Low-level input voltage	Control inputs (referenced to V_{CCA})(5)	V_{CCI} = 1.65 V to 4.5 V		V_{CCA} × 0.35	V
			V_{CCI} = 2.3 V to 2.7 V		0.7	
			V_{CCI} = 3 V to 3.6 V		0.8	
			V_{CCI} = 4.5 V to 5.5 V		V_{CCA} × 0.3	
V_I	Input voltage	Control inputs(3)		0	5.5	V
$V_{I/O}$	Input/output voltage(2)	Active state		0	V_{CCO}	V
		3-State		0	5.5	
I_{OH}	High-level output current		V_{CCO} = 1.65 V to 4.5 V		–4	mA
			V_{CCO} = 2.3 V to 2.7 V		–8	
			V_{CCO} = 3 V to 3.6 V		–24	
			V_{CCO} = 4.5 V to 5.5 V		–32	
I_{OL}	Low-level output current		V_{CCO} = 1.65 V to 4.5 V		4	mA
			V_{CCO} = 2.3 V to 2.7 V		8	
			V_{CCO} = 3 V to 3.6 V		24	
			V_{CCO} = 4.5 V to 5.5 V		32	
Δt/Δv	Input transition rise or fall rate	Data inputs	V_{CCI} = 1.65 V to 4.5 V		20	ns/V
			V_{CCI} = 2.3 V to 2.7 V		20	
			V_{CCI} = 3 V to 3.6 V		10	
			V_{CCI} = 4.5 V to 5.5 V		5	
T_A	Operating free-air temperature			–40	85	°C

(1) V_{CCI} is the V_{CC} associated with the data input port.
(2) V_{CCO} is the V_{CC} associated with the output port.
(3) All unused control inputs of the device must be held at V_{CCA} or GND to ensure proper device operation and minimize power consumption. See *Implications of Slow or Floating CMOS Inputs*, SCBA004.
(4) For V_{CCI} values not specified in the data sheet, V_{IH} min = V_{CCI} × 0.7 V, V_{IL} (max) = V_{CCI} × 0.3 V.
(5) For V_{CCA} values not specified in the data sheet, V_{IH} min = V_{CCA} × 0.7 V, V_{IL} (max) = V_{CCA} × 0.3 V.

6.4 Thermal Information

THERMAL METRIC(1)		SN74LVCH8T245				UNIT
		DB (SSOP)	DGV (TVSOP)	PW (TSSOP)	RHL (VQFN)	
		24 PINS	24 PINS	24 PINS	24 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	88.5	91.1	100.6	37.4	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	48.7	23.7	44.7	38.1	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	44.1	44.5	55.8	15.2	°C/W

				V_{CCA} = 5 V, V_{CCB} = 0 V				–2	
				V_{CCA} = 0 V, V_{CCB} = 5 V				20	
	Combined supply current	V_I = V_{CCI} or GND, I_O = 0		V_{CCA} = V_{CCB} = 1.65 V to 4.5 V				30	µA

6.5 Electrical Characteristics (continued)

All typical limits apply over T_A = 25°C, and all maximum and minimum limits apply over T_A = –40°C to 85°C (unless otherwise noted).(1) (2)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
ΔI_{CCA}	Supply-current change DIR	DIR at V_{CCA} - 0.6 V, B port = open, A port at V_{CCA} or GND	V_{CCA} = V_{CCB} = 3 to 5.5 V			50	µA
C_i	Input capacitance control inputs	V_I = V_{CCA} or GND	V_{CCA} = V_{CCB} = 3.3 V		4	5	pF
C_{io}	Input and output capacitance A or B port	V_O = $V_{CCA/B}$ or GND	V_{CCA} = V_{CCB} = 3.3 V		8.5	10	pF

(1) V_{CCO} is the V_{CC} associated with the output port.
(2) V_{CCI} is the V_{CC} associated with the input port.
(3) The bus-hold circuit can sink at least the minimum low sustaining current at the V_{IL} maximum. I_{BHL} should be measured after lowering V_{IN} to GND and then raising it to V_{IL} maximum.
(4) The bus-hold circuit can source at least the minimum high sustaining current at V_{IH} min. I_{BHH} should be measured after raising V_{IN} to V_{CC} and then lowering it to V_{IH} min.
(5) An external driver must source at least I_{BHLO} to switch this node from low to high.
(6) An external driver must sink at least I_{BHHO} to switch this node from high to low.

6.6 Switching Characteristics: V_{CCA} = 1.8 V ± 0.15 V

over recommended operating free-air temperature range, V_{CCA} = 1.8 V ± 0.15 V (unless otherwise noted) (see Figure 7-1)

NOTES: A. C_L includes probe and jig capacitance.
B. Waveform 1 is for an output with internal conditions such that the output is low, except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high, except when disabled by the output control.
C. All input pulses are supplied by generators having the following characteristics: PRR 10 MHz, Z_O = 50 W, dv/dt ≥ 1 V/ns.
D. The outputs are measured one at a time, with one transition per measurement.
E. t_{PLZ} and t_{PHZ} are the same as t_{dis}.
F. t_{PZL} and t_{PZH} are the same as t_{en}.
G. t_{PLH} and t_{PHL} are the same as t_{pd}.
H. V_{CCI} is the V_{CC} associated with the input port.
I. V_{CCO} is the V_{CC} associated with the output port.
J. All parameters and waveforms are not applicable to all devices.

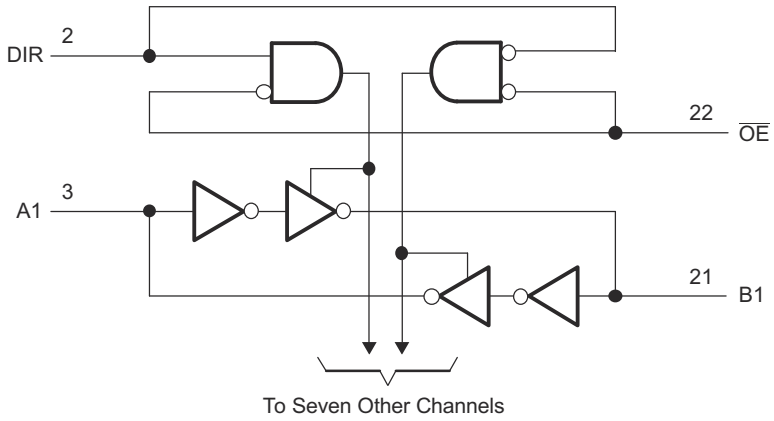
Figure 7-1. Load Circuit and Voltage Waveforms

8 Detailed Description

8.1 Overview

The SN74LVCH8T245 is an 8-bit, dual supply noninverting voltage level translator. Pins A1 through A4, and the control pins (DIR and $\overline{OE}$) are referenced to V_{CCA}, while pins B1 through B4 are referenced to V_{CCB}. Both the A port and B port can accept I/O voltages ranging from 1.65 V to 5.5 V. The high on DIR allows data transmission from Port A to Port B, and a low on DIR allows data transmission from Port B to Port A. For more information, see *AVC Logic Family Technology and Applications*.

8.2 Functional Block Diagram



8.3 Feature Description

8.3.1 Fully Configurable Dual-Rail Design

Both V_{CCA} and V_{CCB} can be supplied at any voltage from 1.65 V to 5.5 V, making the device suitable for translating between any of the voltage nodes: 1.8 V, 2.5 V, 3.3 V, and 5 V.

8.3.2 Partial-Power-Down Mode Operation

I_{off} circuitry disables the outputs, preventing damaging current backflow through the device when it is powered down. This can occur in applications where subsections of a system are powered down (partial power down) to reduce power consumption. The maximum leakage into or out of any input or output pin on the device is specified by I_{off} in the *Electrical Characteristics*.

8.3.3 Active Bus Hold Circuitry

Active bus-hold circuitry holds unused or undriven inputs at a valid logic state, which helps with board space savings and reduced component costs. Use of pullup or pulldown resistors with the bus-hold circuitry is not recommended as this eliminates the bus-hold feature.

8.3.4 Balanced High-Drive CMOS Push-Pull Outputs

A balanced output allows the device to sink and source similar currents. The high drive capability of this device creates fast edges into light loads so routing and load conditions should be considered to prevent ringing. Additionally, the outputs of this device are capable of driving larger currents than the device can sustain without being damaged. Two outputs can be connected together for 2X stronger output drive strength. The electrical and thermal limits defined in the *Absolute Maximum Ratings* must be followed at all times.

8.3.5 V_{CC} Isolation

The V_{CC} isolation feature ensures that if either V_{CCA} or V_{CCB} are at GND (or < 0.4 V), both ports will be in a high-impedance state (I_{OZ} shown in *Electrical Characteristics*). This prevents false logic levels from being presented to either bus.

8.4 Device Functional Modes

Table 8-1 lists the functional modes of the SN74LVCH8T245.

Table 8-1. Function Table (Each 8-Bit Section)

CONTROL INPUTS(1)		OUTPUT CIRCUITS		OPERATION
$\overline{OE}$	DIR	A PORT	B PORT	
L	L	Enabled	Hi-Z	B data to A bus
L	H	Hi-Z	Enabled	A data to B bus
H	X	Hi-Z	Hi-Z	Isolation

(1) Input circuits of the data I/Os are always active.

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The SN74LVCH8T245 device can be used in level-translation applications for interfacing devices or systems operating at different interface voltages with one another. The maximum output current can be up to 32 mA when device is powered by 5 V.

9.2 Typical Application

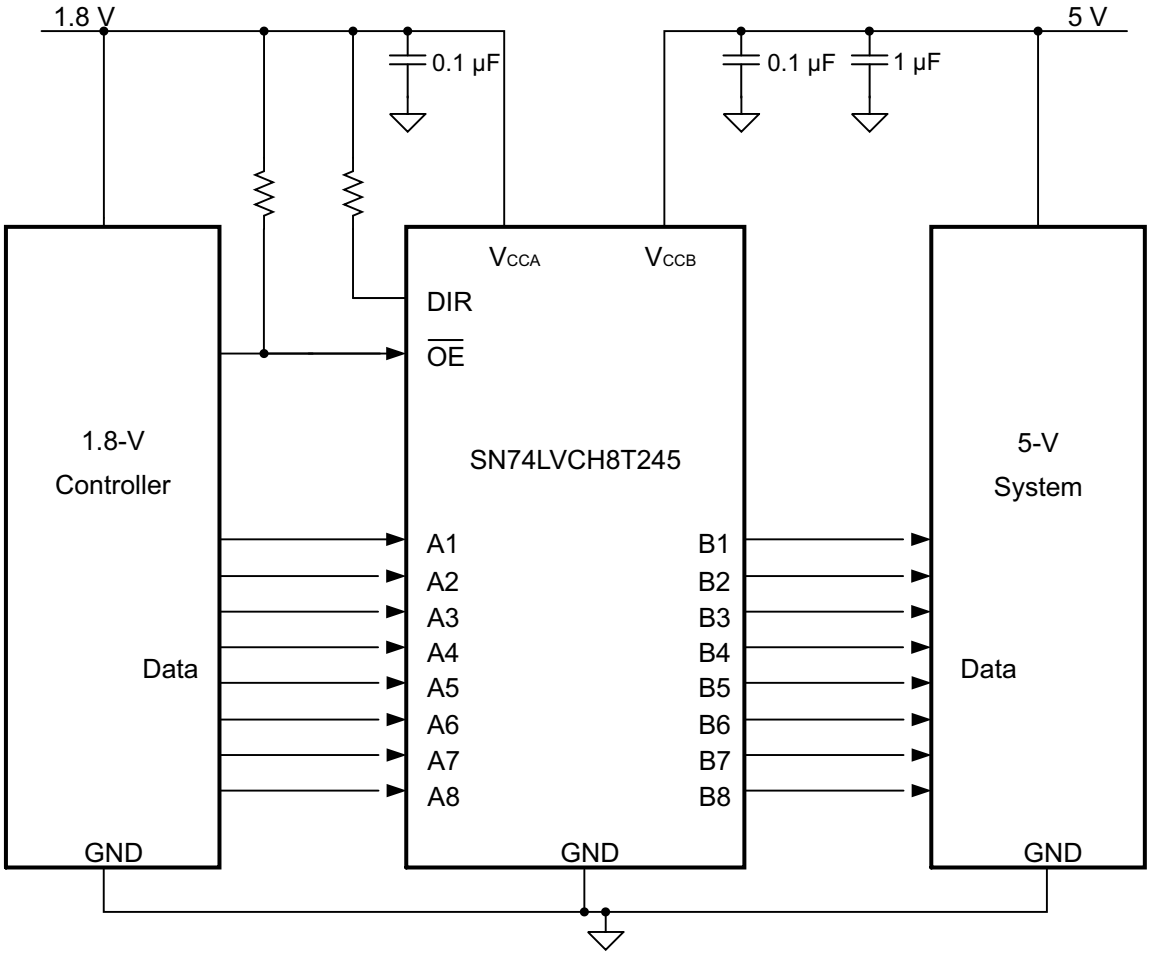


Figure 9-1. Typical Application Circuit

9.2.1 Design Requirements

For this design example, use the parameters listed in Table 9-1.

Table 9-1. Design Parameters

PARAMETERS	VALUES
Input voltage	1.65 V to 5.5 V
Output voltage	1.65 V to 5.5 V

9.2.2 Detailed Design Procedure

To begin the design process, determine the following:

- Input voltage range
  - Use the supply voltage of the device that is driving the SN74LVCH8T245 to determine the input voltage range. For a valid logic high, the value must exceed the V_{IH} of the input port. For a valid logic low, the value must be less than the V_{IL} of the input port.
- Output voltage range
  - Use the supply voltage of the device that the SN74LVCH8T245 is driving to determine the output voltage range.

9.2.2.1 Enable Times

Calculate the enable times for the SN74LVCH8T245 using Equation 1, Equation 2, Equation 3, and Equation 4:

$$t_{PZH}\text{ (DIR to A)} = t_{PLZ}\text{ (DIR to B)} + t_{PLH}\text{ (B to A)} \quad (1)$$

$$t_{PZL}\text{ (DIR to A)} = t_{PHZ}\text{ (DIR to B)} + t_{PHL}\text{ (B to A)} \quad (2)$$

$$t_{PZH}\text{ (DIR to B)} = t_{PLZ}\text{ (DIR to A)} + t_{PLH}\text{ (A to B)} \quad (3)$$

$$t_{PZL}\text{ (DIR to B)} = t_{PHZ}\text{ (DIR to A)} + t_{PHL}\text{ (A to B)} \quad (4)$$

In a bidirectional application, these enable times provide the maximum delay from the time the DIR bit is switched until an output is expected. For example, if the device initially is transmitting from A to B, then the DIR bit is switched; the B port of the device must be disabled before presenting it with an input. After the B port has been disabled, an input signal applied to it appears on the corresponding A port after the specified propagation delay.

9.2.3 Application Curve

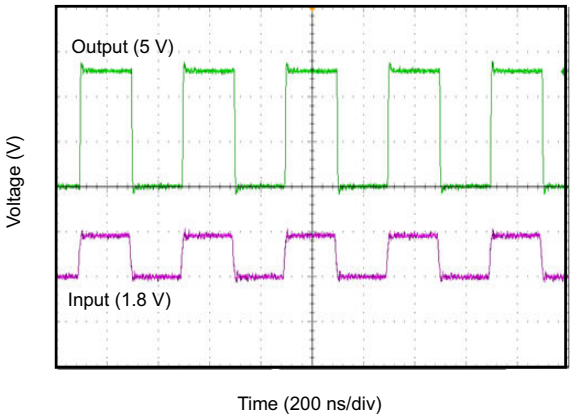

Figure 9-2. Translation Up (1.8 V to 5 V) at 2.5 MHz

10 Power Supply Recommendations

The output-enable ($\overline{OE}$) input circuit is designed so that it is supplied by V_{CCA} and when the $\overline{OE}$ input is high, all outputs are placed in the high-impedance state. To ensure the high-impedance state of the outputs during power up or power down, the $\overline{OE}$ input pin must be tied to V_{CCA} through a pullup resistor and must not be enabled until V_{CCA} and V_{CCB} are fully ramped and stable. The minimum value of the pullup resistor to V_{CCA} is determined by the current-sinking capability of the driver.

V_{CCA} or V_{CCB} can be powered up first. If the SN74LVCH8T245 is powered up in a permanently enabled state (for example $\overline{OE}$ is always kept low), pullup resistors are recommended at the input. This ensures proper, glitch-free, power-up. For more information, see *Designing with SN4LVCXT245 and SN74LVCHXT245 Family of Direction Controlled Voltage Translators/Level-Shifters*. In addition, the $\overline{OE}$ pin may be shorted to GND if the application does not require use of the high-impedance state at any time.

11 Layout

11.1 Layout Guidelines

To ensure reliability of the device, TI recommends the following common printed-circuit board layout guidelines.

- Bypass capacitors should be used on power supplies.
- Short trace lengths should be used to avoid excessive loading.
- Placing pads on the signal paths for loading capacitors or pullup resistors helps adjust rise and fall times of signals depending on the system requirements.

11.2 Layout Example

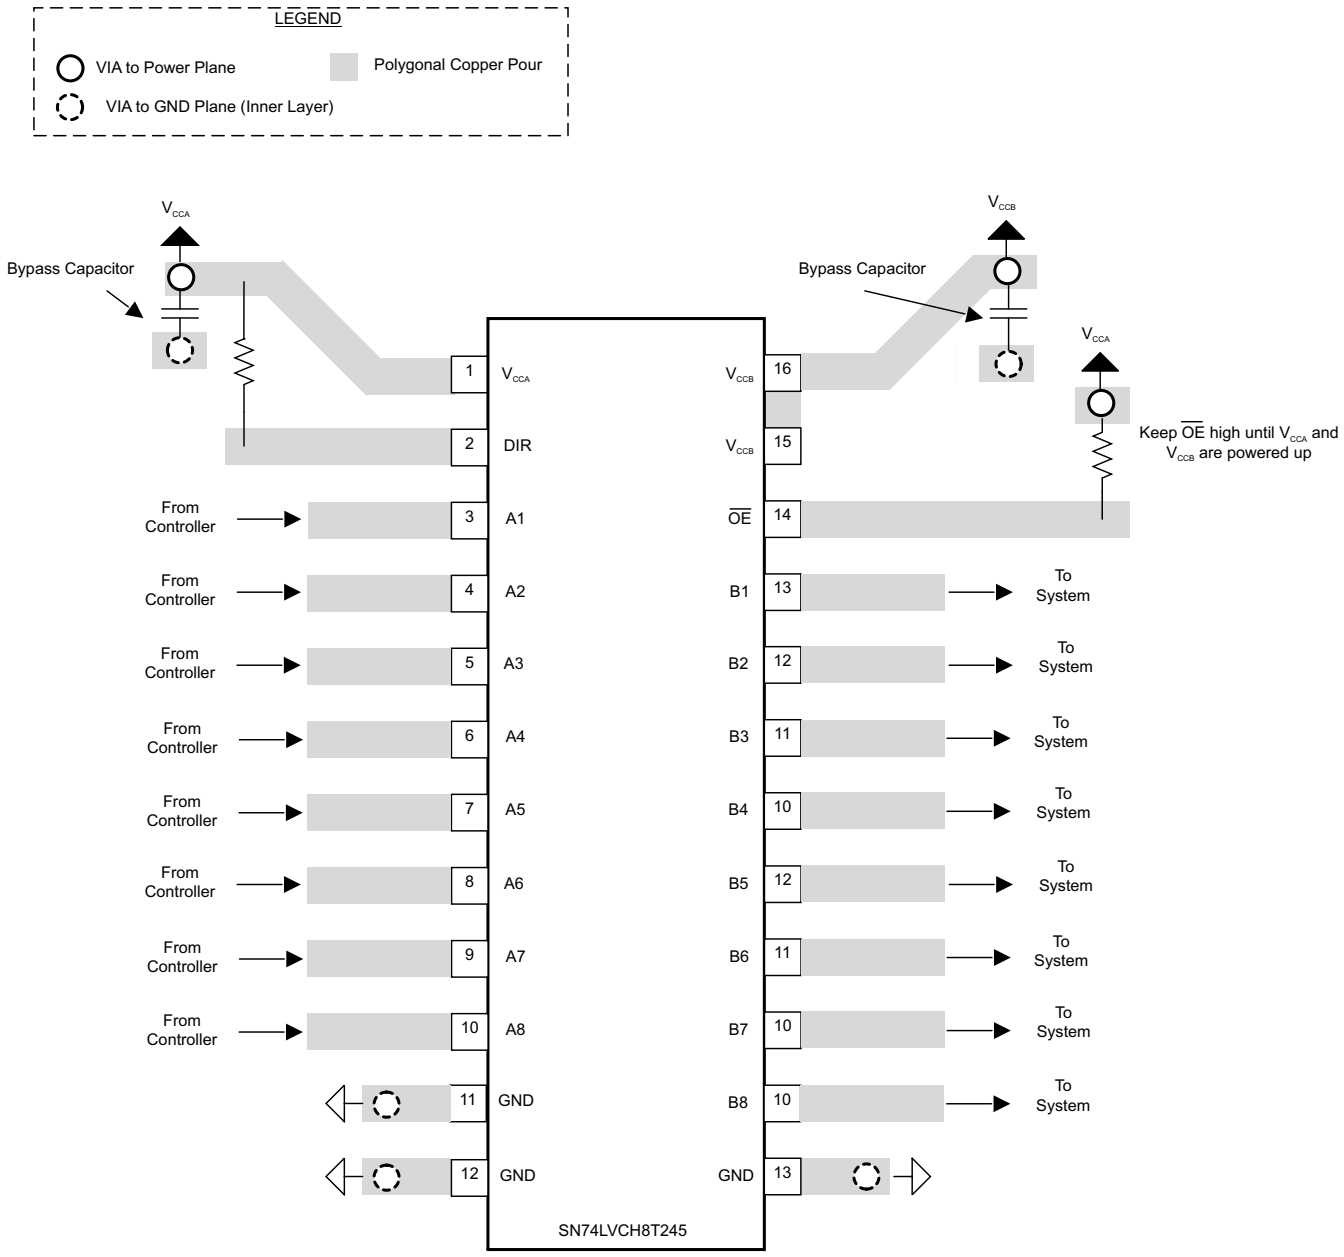

Figure 11-1. SN74LVCH8T245 Layout

12 Device and Documentation Support

12.1 Documentation Support

12.1.1 Related Documentation

For related documentation, see the following:

12.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.3 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

12.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.6 Glossary

TI Glossary	This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
