

## TLC555 LinCMOS™ Timer

### 1 Features

- Very low power consumption:
  - 1-mW typical at  $V_{DD} = 5\text{ V}$
- Capable of operation in astable mode
- CMOS output capable of swinging rail to rail
- High output current capability
  - Sink: 100-mA typical
  - Source: 10-mA typical
- Output fully compatible with CMOS, TTL, and MOS
- Low supply current reduces spikes during output transitions
- Single-supply operation from 2 V to 15 V
- Functionally interchangeable with the NE555; has same pinout
- ESD protection exceeds 2000 V per MIL-STD-883C, method 3015.2
- Available in Q-temp automotive
  - High-reliability automotive applications
  - Configuration control and print support
  - Qualification to automotive standards

### 2 Applications

- Precision timing
- Pulse generation
- Sequential timing
- Time delay generation
- Pulse width modulation
- Pulse position modulation
- Linear ramp generator

### 3 Description

The TLC555 is a monolithic timing circuit fabricated using the TI LinCMOS™ process. The timer is fully compatible with CMOS, TTL, and MOS logic and operates at frequencies up to 2 MHz. Because of its high input impedance, this device supports smaller timing capacitors than those supported by the NE555 or LM555. As a result, more accurate time delays and oscillations are possible. Power consumption is low across the full range of power-supply voltage.

Like the NE555, the TLC555 has a trigger level equal to approximately one-third of the supply voltage and a threshold level equal to approximately two-thirds of the supply voltage. These levels can be altered by use of the control voltage terminal (CONT). When the trigger input (TRIG) falls below the trigger level, the flip-flop is set and the output goes high. If TRIG is above the trigger level and the threshold input (THRES) is above the threshold level, the flip-flop is reset and the output is low. The reset input (RESET) can override all other inputs and can be used to initiate a new timing cycle. If RESET is low, the flip-flop is reset and the output is low. Whenever the output is low, a low-impedance path is provided between the discharge terminal (DISCH) and GND. All unused inputs must be tied to an appropriate logic level to prevent false triggering.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TLC555C	SOIC (8)	4.90 mm x 3.91 mm
	PDIP (8)	9.81 mm x 6.38 mm
	SOP (8)	6.20 mm x 5.30 mm
	TSSOP (14)	5.00 mm x 4.40 mm
TLC555I	SOIC (8)	4.90 mm x 3.91 mm
	PDIP (8)	9.81 mm x 6.38 mm
TLC555M	LCCC (20)	8.89 mm x 8.89 mm
	CDIP (8)	9.60 mm x 6.67 mm
TLC555Q	SOIC (8)	4.90 mm x 3.91 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 4 Revision History

### Changes from Revision H (August 2016) to Revision I

Page

• Added MIN value for input voltage in <i>Absolute Maximum Ratings</i> .....	6
• Added discharge pin in <i>Absolute Maximum Ratings</i> .....	6
• Changed MIN supply voltage based on part number in <i>Recommended Operating Conditions</i> .....	6
• Added power dissipation capacitance TYP value in <i>Electrical Characteristics: <math>V_{DD} = 2\text{ V}</math> for TLC555C, <math>V_{DD} = 3\text{ V}</math> for TLC555I</i> .....	7
• Added trigger, threshold capacitance TYP value in <i>Electrical Characteristics: <math>V_{DD} = 5\text{ V}</math></i> .....	8
• Changed $V_{OH}$ test condition current to $-1\text{ mA}$ in <i>Electrical Characteristics: <math>V_{DD} = 5\text{ V}</math></i> .....	8
• Added power dissipation capacitance TYP value in <i>Electrical Characteristics: <math>V_{DD} = 5\text{ V}</math></i> .....	9
• Added trigger, threshold capacitance TYP value in <i>Electrical Characteristics: <math>V_{DD} = 15\text{ V}</math></i> .....	9
• Added power dissipation capacitance TYP value in <i>Electrical Characteristics: <math>V_{DD} = 15\text{ V}</math></i> .....	10
• Added <i>Operating Characteristics</i> to the <i>Specifications</i> section.....	11
• Added Supply Current vs Supply Voltage chart to the <i>Typical Characteristics</i> section .....	12
• Added Control Impedance vs Temperature chart to the <i>Typical Characteristics</i> section .....	12
• Added Output Low Resistance vs Temperature chart to the <i>Typical Characteristics</i> section.....	12
• Added Output High Resistance vs Temperature chart to the <i>Typical Characteristics</i> section.....	12
• Added Propagation Delay vs Control Voltage chart, $V_{DD} = 2\text{ V}$ to the <i>Typical Characteristics</i> section .....	12
• Added Propagation Delay vs Control Voltage chart, $V_{DD} = 5\text{ V}$ to the <i>Typical Characteristics</i> section .....	12
• Changed trigger high hold time to $1\text{ }\mu\text{s}$ in the <i>Monostable Operation</i> section .....	15
• Changed minimum monostable pulse width to $1\text{ }\mu\text{s}$ in the <i>Monostable Operation</i> section.....	15
• Changed Output Pulse Duration vs Capacitance chart scale down to $0.001\text{ ms}$ in the <i>Monostable Operation</i> section.....	15
• Added more astable frequency formulas to the <i>Astable Operation</i> section .....	17
• Changed scale on Free-Running Frequency vs Timing Capacitance chart up to $2\text{ MHz}$ in the <i>Astable Operation</i> section .....	18
• Added CONT pin table note to the Function Table in the <i>Device Functional Modes</i> section .....	19
• Changed the application curve chart in the <i>Pulse-Width Modulation</i> section .....	22
• Changed the application curve charts in the <i>Pulse-Position Modulation</i> section.....	23
• Added clamping diodes to Sequential Timer Circuit in the <i>Sequential Timer</i> section.....	24

**Revision History (continued)**

- Added *Designing for Improved ESD Performance* section to the *Application Information* section ..... [25](#)
- 

**Changes from Revision G (November 2008) to Revision H**
**Page**

- Added *Feature Description* section, *Device Functional Modes, Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section ..... [1](#)
  - Changed values in the *Thermal Information* table to align with JEDEC standards..... [6](#)
  - Deleted *Dissipation Ratings* table ..... [6](#)
-

## 5 Pin Configuration and Functions

**D, P, PS, and JG Packages**  
**8-Pin SOIC, PDIP, SOP, CDIP**  
**Top View**

**Pin Functions: D, P, PS, and JG Packages**

PIN		I/O	DESCRIPTION
NAME	SOIC, PDIP, SOP, CDIP		
CONT	5	I	Controls comparator thresholds. Outputs 2/3 V <sub>DD</sub> and allows bypass capacitor connection.
DISCH	7	O	Open collector output to discharge timing capacitor.
GND	1	—	Ground.
NC	—	—	No internal connection.
OUT	3	O	High current timer output signal.
RESET	4	I	Active low reset input forces output and discharge low.
THRES	6	I	End of timing input. THRES > CONT sets output low and discharge low.
TRIG	2	I	Start of timing input. TRIG < 1/2 CONT sets output high and discharge open.
V <sub>DD</sub>	8	—	Power-supply voltage.

### Pin Functions: PW and FK

NAME	PIN		I/O	DESCRIPTION
	TSSOP	LCCC		
CONT	8	12	I	Controls comparator thresholds. Outputs $2/3 V_{DD}$ and allows bypass capacitor connection.
DISCH	12	17	O	Open-collector output to discharge timing capacitor.
GND	1	2	—	Ground.
NC	2, 4, 6, 9, 11, 13	1, 3, 4, 6, 8, 9, 11, 13, 14, 16, 18, 19	—	No internal connection.
OUT	5	7	O	High current timer output signal.
RESET	7	10	I	Active low reset input forces output and discharge low.
THRES	10	15	I	End of timing input. $THRES > CONT$ sets output low and discharge low.
TRIG	3	5	I	Start of timing input. $TRIG < 1/2 CONT$ sets output high and discharge open.
$V_{DD}$	14	20	—	Power-supply voltage.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup> *Continuous total power dissipation and lead temperature parameters from [Absolute Maximum Ratings](#)*

		MIN	MAX	UNIT	
Voltage	Supply, V <sub>DD</sub> <sup>(2)</sup>	-0.3	18	V	
	Input, any input	-0.3	V <sub>DD</sub>		
	Discharge	-0.3	18		
Current	Sink, discharge or output		150	mA	
	Source, output, I <sub>O</sub>		15		
Temperature	Operating, T <sub>A</sub>	C-suffix	0	70	°C
		I-suffix	-40	85	
		Q-suffix	-40	125	
		M-suffix	-55	125	
	Case, for 60 seconds	FK package	-65	150	
	Storage, T <sub>stg</sub>	-65	150		

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network GND.

### 6.2 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
Supply voltage, V <sub>DD</sub>	TLC555C	2	15	V
	TLC555I	3	15	
	TLC555M	5	15	
	TLC555Q	5	15	
Operating free-air temperature, T <sub>A</sub>	TLC555C	0	70	°C
	TLC555I	-40	85	
	TLC555M	-55	125	
	TLC555Q	-40	125	

### 6.3 Thermal Information

THERMAL METRIC <sup>(1)</sup>	TLC555						UNIT	
	D (SOIC)	FK (LCCC)	JG (CDIP)	P (PDIP)	PS (SOP)	PW (TSSOP)		
	8 PINS	20 PINS	8 PINS	8 PINS	8 PINS	14 PINS		
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	113	n/a	120	58	120	135	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	58	37	81	48	72	61	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	55	36	110	35	69	77	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	11	n/a	45	26	32	12	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	54	n/a	103	35	68	77	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	n/a	4.3	31	n/a	n/a	n/a	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.

## 6.4 Electrical Characteristics: $V_{DD} = 2\text{ V}$ for TLC555C, $V_{DD} = 3\text{ V}$ for TLC555I

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS <sup>(1)</sup>		MIN	TYP	MAX	UNIT
$V_{IT}$	Threshold voltage	25°C	TLC555C	0.95	1.33	1.65	V
			TLC555I	1.6		2.4	
		Full range	TLC555C	0.85		1.75	
			TLC555I	1.5		2.5	
$I_{IT}$	Threshold current	25°C	TLC555C		10		pA
			TLC555I		10		
		Max	TLC555C		75		
			TLC555I		150		
$V_{I(TRIG)}$	Trigger voltage	25°C	TLC555C	0.4	0.67	0.95	V
			TLC555I	0.71	1	1.29	
		Full range	TLC555C	0.3		1.05	
			TLC555I	0.61		1.39	
$I_{I(TRIG)}$	Trigger current	25°C	TLC555C		10		pA
			TLC555I		10		
		Max	TLC555C		75		
			TLC555I		150		
$V_{I(RESET)}$	Reset voltage	25°C	TLC555C	0.4	1.1	1.5	V
			TLC555I	0.4	1.1	1.5	
		Full range	TLC555C	0.3		2	
			TLC555I	0.3		1.8	
Control voltage (open-circuit) as a percentage of supply voltage	Max	TLC555C		66.7%			
		TLC555I		66.7%			
Discharge switch on-stage voltage	$I_{OL} = 1\text{ mA}$ , 25°C	TLC555C		0.03	0.2	V	
		TLC555I		0.03	0.2		
		$I_{OL} = 1\text{ mA}$ , Full range	TLC555C				0.25
			TLC555I				0.375
Discharge switch off-stage current	25°C	TLC555C		0.1		nA	
		TLC555I		0.1			
	Max	TLC555C		0.5			
		TLC555I		120			
$V_{OH}$	High-level output voltage	$I_{OH} = -300\text{ }\mu\text{A}$ , 25°C	TLC555C	1.5	1.9		V
			TLC555I	2.5	2.85		
		$I_{OH} = -300\text{ }\mu\text{A}$ , Full range	TLC555C	1.5			
			TLC555I	2.5			
$V_{OL}$	Low-level output voltage	$I_{OL} = 1\text{ mA}$ , 25°C	TLC555C		0.07	0.3	V
			TLC555I		0.07	0.3	
		$I_{OL} = 1\text{ mA}$ , Full range	TLC555C			0.35	
			TLC555I			0.4	
$I_{DD}$	Supply current <sup>(2)</sup>	25°C	TLC555C			250	$\mu\text{A}$
			TLC555I			250	
		Full range	TLC555C			400	
			TLC555I			500	
$C_{PD}$	Power dissipation capacitance <sup>(3)(4)</sup>	25°C	TLC555C		80		pF
			TLC555I		90		

(1) Full range is 0°C to 70°C for the TLC555C, and –40°C to 85°C for the TLC555I. For conditions shown as **Max**, use the appropriate value specified in the [Recommended Operating Conditions](#) table.

(2) These values apply for the expected operating configurations in which THRES is connected directly to DISCH or to TRIG.

(3)  $C_{PD}$  is used to determine the dynamic power consumption.

(4)  $P_D = V_{DD}^2 f_o (C_{PD} + C_L)$  where  $f_o$  = output frequency,  $C_L$  = output load capacitance,  $V_{DD}$  = supply voltage

## 6.5 Electrical Characteristics: $V_{DD} = 5\text{ V}$

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS <sup>(1)</sup>		MIN	TYP	MAX	UNIT
$V_{IT}$	Threshold voltage	25°C	TLC555C, TLC555I, TLC555M, TLC555Q	2.8	3.3	3.8	V
		Full range	TLC555C, TLC555I, TLC555M, TLC555Q	2.7		3.9	
$I_{IT}$	Threshold current	25°C	TLC555C, TLC555I, TLC555M, TLC555Q		10		pA
		Max	TLC555C		75		
			TLC555I		150		
	TLC555M, TLC555Q		5000				
$V_{I(TRIG)}$	Trigger voltage	25°C	TLC555C, TLC555I, TLC555M, TLC555Q	1.36	1.66	1.96	V
		Full range	TLC555C, TLC555I, TLC555M, TLC555Q	1.26		2.06	
$I_{I(TRIG)}$	Trigger current	25°C	TLC555C, TLC555I, TLC555M, TLC555Q		10		pA
		Max	TLC555C		75		
			TLC555I		150		
	TLC555M, TLC555Q		5000				
$C_I$	Trigger, threshold capacitance (each pin)	25°C	TLC555C, TLC555I, TLC555M, TLC555Q		2.1		pF
$V_{I(RESET)}$	Reset voltage	25°C	TLC555C, TLC555I, TLC555M, TLC555Q	0.4	1.1	1.5	V
		Full range	TLC555C, TLC555I, TLC555M, TLC555Q	0.3		1.8	
$I_{I(RESET)}$	Reset current	25°C	TLC555C, TLC555I, TLC555M, TLC555Q		10		pA
		Max	TLC555C		75		
			TLC555I		150		
	TLC555M, TLC555Q		5000				
	Control voltage (open circuit) as a percentage of supply voltage	Max	TLC555C, TLC555I, TLC555M, TLC555Q		66.7%		
	Discharge switch on-stage voltage	$I_{OL} = 10\text{ mA}$ , 25°C	TLC555C, TLC555I, TLC555M, TLC555Q		0.14	0.5	V
		$I_{OL} = 10\text{ mA}$ , Full range	TLC555C, TLC555I, TLC555M, TLC555Q			0.6	
	Discharge switch off-stage current	25°C	TLC555C, TLC555I, TLC555M, TLC555Q		0.1		nA
		Max	TLC555C		0.5		
			TLC555I		120		
	TLC555M, TLC555Q		120				
$V_{OH}$	High-level output voltage	$I_{OH} = -1\text{ mA}$ , 25°C	TLC555C, TLC555I, TLC555M, TLC555Q	4.1	4.8		V
		$I_{OH} = -1\text{ mA}$ , Full range	TLC555C, TLC555I, TLC555M, TLC555Q	4.1			
$V_{OL}$	Low-level output voltage	$I_{OL} = 8\text{ mA}$ , 25°C	TLC555C, TLC555I, TLC555M, TLC555Q		0.21	0.4	V
		$I_{OL} = 8\text{ mA}$ , Full range	TLC555C		0.5		
			TLC555I		0.5		
	TLC555M, TLC555Q		0.6				

(1) Full range is 0°C to 70°C for the TLC555C, -40°C to 85°C for the TLC555I, -40°C to 125°C for the TLC555Q, and -55°C to 125°C for the TLC555M. For conditions shown as **Max**, use the appropriate value specified in the [Recommended Operating Conditions](#) table.

**Electrical Characteristics:  $V_{DD} = 5\text{ V}$  (continued)**

over operating free-air temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS <sup>(1)</sup>		MIN	TYP	MAX	UNIT	
$V_{OL}$ Low-level output voltage	$I_{OL} = 5\text{ mA}$ , 25°C	TLC555C, TLC555I, TLC555M, TLC555Q		0.13	0.3	V

## 7 Detailed Description

### 7.1 Overview

The TLC555 is a precision timing device used for general-purpose timing applications up to 2.1 MHz. All inputs are level sensitive not edge triggered inputs.

### 7.2 Functional Block Diagram

Pin numbers are for all packages except the PW and FK package. RESET can override TRIG, which can override THRES (when CONT pin is  $2/3 V_{DD}$ ).

The resistance of "R" resistors vary with  $V_{DD}$  and temperature. The resistors match each other very well across  $V_{DD}$  and temperature for a temperature stable control voltage ratio.

### 7.3 Feature Description

#### 7.3.1 Monostable Operation

For monostable operation, any of these timers can be connected as shown in [Figure 9](#). If the output is low, application of a negative-going pulse to the trigger (TRIG) sets the internal latch; the output goes high, and discharge pin (DISCH) becomes open drain. Capacitor C then is charged through  $R_A$  until the voltage across the capacitor reaches the threshold voltage of the threshold (THRES) input. If TRIG has returned to a high level, the output of the threshold comparator resets the internal latch, the output goes low, the discharge pin goes low which quickly discharges capacitor C.

Feature Description (continued)

Figure 9. Circuit for Monostable Operation

Monostable operation is initiated when TRIG voltage falls below the trigger threshold. Once initiated, the sequence ends only if TRIG is high for at least 1  $\mu$ s before the end of the timing interval. When the trigger is grounded, the comparator storage time can be as long as 1  $\mu$ s, which limits the minimum monostable pulse width to 1  $\mu$ s. The output pulse duration is approximately  $t_w = 1.1 \times R_A C$ . Figure 11 is a plot of the time constant for various values of  $R_A$  and  $C$ . The threshold levels and charge rates both are directly proportional to the supply voltage,  $V_{DD}$ . The timing interval is, therefore, independent of the supply voltage, so long as the supply voltage is constant during the time interval.

Applying a negative-going trigger pulse simultaneously to RESET and TRIG during the timing interval discharges capacitor  $C$  and reinitiates the cycle, commencing on the positive edge of the reset pulse. The output is held low as long as the reset pulse is low. To prevent false triggering, when RESET is not used it must be connected to  $V_{DD}$ .

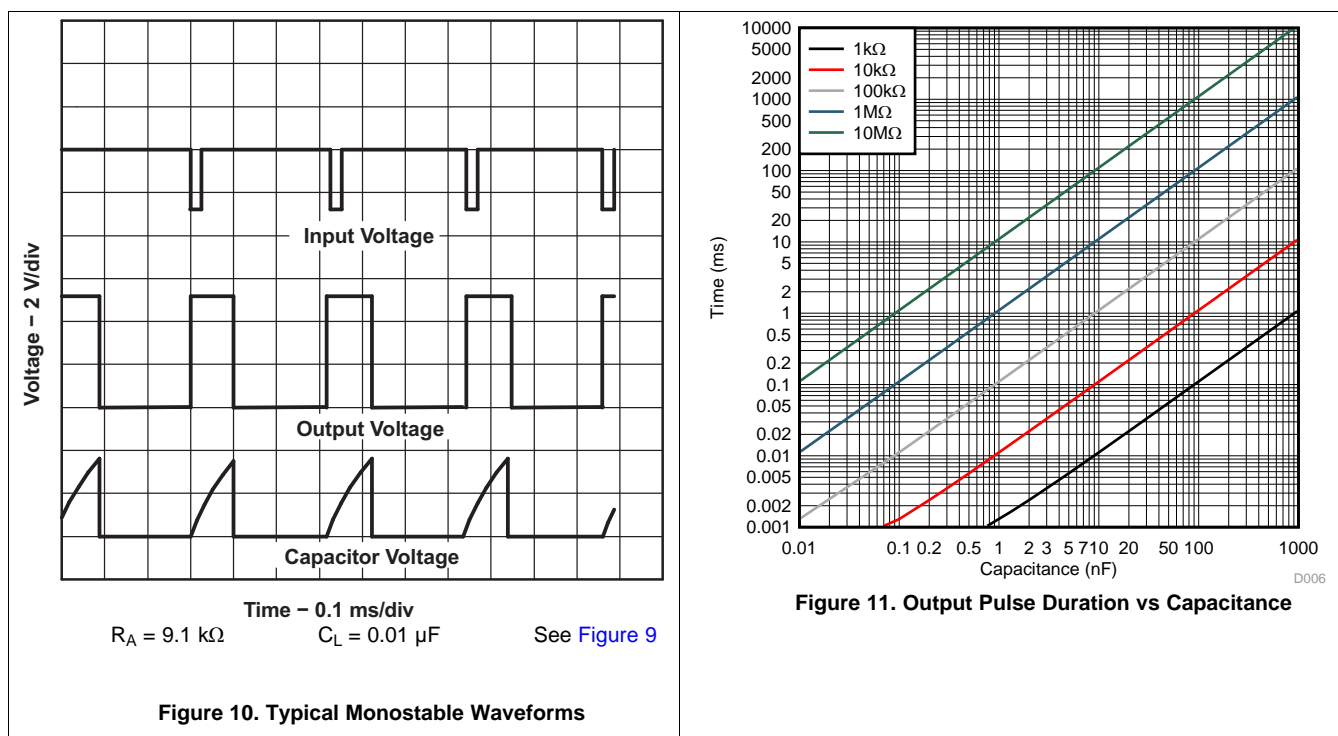

Figure 10. Typical Monostable Waveforms

Figure 11. Output Pulse Duration vs Capacitance

## Feature Description (continued)

### 7.3.2 Astable Operation

As shown in [Figure 12](#), adding a second resistor,  $R_B$ , to the circuit of [Figure 9](#) and connecting the trigger input to the threshold input causes the timer to self-trigger and run as a multi-vibrator. The capacitor  $C$  charges through  $R_A$  and  $R_B$  and then discharges through  $R_B$  only. Therefore, the duty cycle is controlled by the values of  $R_A$  and  $R_B$ .

This astable connection results in capacitor  $C$  charging and discharging between the threshold-voltage level ( $\approx 0.67 \times V_{CC}$ ) and the trigger-voltage level ( $\approx 0.33 \times V_{CC}$ ). As in the monostable circuit, charge and discharge times (and, therefore, the frequency and duty cycle) are independent of the supply voltage.

[Figure 13](#) shows typical waveforms generated during astable operation. The output high-level duration  $t_H$  and low-level duration  $t_L$  for frequencies below 100 kHz can be calculated as follows:

$$t_H = 0.693(R_A + R_B)C \tag{1}$$

$$t_L = 0.693(R_B)C \tag{2}$$

Other useful relationships are shown below:

$$\text{period} = t_H + t_L = 0.693(R_A + 2R_B)C \tag{3}$$

$$\text{frequency} \approx \frac{1.44}{(R_A + 2R_B)C} \tag{4}$$

$$\text{Output driver duty cycle} = \frac{t_L}{t_H + t_L} = \frac{R_B}{R_A + 2R_B} \tag{5}$$

$$\text{Output waveform duty cycle} = \frac{t_H}{t_H + t_L} = 1 - \frac{R_B}{R_A + 2R_B} \tag{6}$$

$$\text{Low-to-high ratio} = \frac{t_L}{t_H} = \frac{R_B}{R_A + R_B} \tag{7}$$

**Feature Description (continued)**

The formulas (1-7) do not account for any propagation delay times from the TRIG and THRES inputs to DISCH output. These delay times add directly to the period and overcharge the capacitor which creates differences between calculated and actual values that increase with frequency. In addition, the internal on-state resistance  $r_{on}$  during discharge adds to  $R_B$  to provide another source of timing error in the calculation when  $R_B$  is very low. The equations below provide better agreement with measured values. The formulas Equation 8 represent the actual low and high times when used at higher frequencies because propagation delay and discharge on resistance is added to the formulas. Because the formulas are complex, a calculation tool, [TLC555 Design Calculator](#) can be used to calculate the component values.

$$t_{c(H)} = C_T (R_A + R_B) \ln \left[ 3 - \exp \left( \frac{-t_{PHL}}{C_T (R_B + r_{on})} \right) \right] + t_{PHL}$$

$$t_{c(L)} = C_T (R_B + r_{on}) \ln \left[ 3 - \exp \left( \frac{-t_{PLH}}{C_T (R_A + R_B)} \right) \right] + t_{PLH}$$
(8)

Feature Description (continued)

Figure 15. Free-Running Frequency vs Timing Capacitance  
Resistance =  $R_A + 2 \times R_B$

7.3.3 Frequency Divider

By adjusting the length of the timing cycle, the basic circuit of Figure 9 can be made to operate as a frequency divider. Figure 16 shows a divide-by-three circuit that makes use of the fact that re-triggering cannot occur during the timing cycle.

Figure 16. Divide-by-Three Circuit Waveforms

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The TLC555 timer device uses resistor and capacitor charging delay to provide a programmable time delay or operating frequency. The [Typical Applications](#) section presents a simplified discussion of the design process. Reset mode forces output and discharge low and provides a small reduction in supply current.

### 8.2 Typical Applications

#### 8.2.1 Missing-Pulse Detector

The circuit shown in [Figure 18](#) can be used to detect a missing pulse or abnormally long spacing between consecutive pulses in a train of pulses. The timing interval of the monostable circuit is re-triggered continuously by the input pulse train as long as the pulse spacing is less than the timing interval. A longer pulse spacing, missing pulse, or terminated pulse train permits the timing interval to be completed, thereby generating an output pulse as shown in [Figure 19](#).

**Figure 18. Circuit for Missing-Pulse Detector**

##### 8.2.1.1 Design Requirements

Input fault (missing pulses) must be input high. An input stuck low cannot be detected because the timing capacitor (C) remains discharged.

##### 8.2.1.2 Detailed Design Procedure

Choose  $R_A$  and  $C$  so that  $R_A \times C > [\text{maximum normal input high time}]$ .

## Typical Applications (continued)

### 8.2.1.3 Application Curve

### 8.2.2 Pulse-Width Modulation

The operation of the timer can be modified by modulating the internal threshold and trigger voltages, which is accomplished by applying an external voltage (or current) to CONT. Figure 20 shows a circuit for pulse-width modulation. A continuous input pulse train triggers the monostable circuit, and a control signal modulates the threshold voltage. Figure 21 shows the resulting duty cycle versus control voltage transfer function. Attempting to run under 10% duty cycle could result in inconsistent output pulses. Attempting to run close to 100% duty cycle will result in frequency division by 2, then 3, then 4.

- A. The modulating signal can be direct or capacitively coupled to CONT. For direct coupling, consider the effects of modulation source voltage and impedance on the bias of the timer.

**Figure 20. Circuit for Pulse-Width Modulation**

## Typical Applications (continued)

### 8.2.2.1 Design Requirements

The clock input must have  $V_{OL}$  and  $V_{OH}$  levels that are less than and greater than  $1/3 V_{DD}$ , respectively. Clock input  $V_{OL}$  time must be less than minimum output high time, therefore a high (positive) duty cycle clock is recommended. Minimum recommended modulation voltage is 1 V. Lower CONT voltage can greatly increase threshold comparator's propagation delay and storage time. The application must be tolerant of a nonlinear transfer function; the relationship between modulation input and pulse width is not linear because the capacitor charge is RC based with an negative exponential curve.

### 8.2.2.2 Detailed Design Procedure

Choose  $R_A$  and  $C$  so that  $R_A \times C$  is same or less than clock input period. [Figure 21](#) shows the non linear relationship between control voltage and output duty cycle. Duty cycle is function of control voltage and clock period relative to RC time constant.

### 8.2.2.3 Application Curve

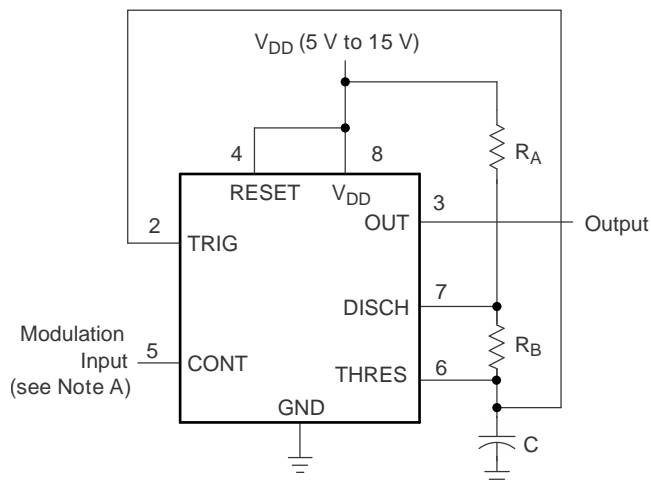

**Figure 21. Pulse-Width-Modulation vs Control Voltage**  
**Clock Duty Cycle 98%,  $V_{DD} = 5\text{ V}$**

### 8.2.3 Pulse-Position Modulation

As shown in [Figure 22](#), any of these timers can be used as a pulse-position modulator. This application modulates the threshold voltage and thereby the time delay of a free-running oscillator. [Figure 23](#) and [Figure 24](#) shows the output frequency and duty cycle versus control voltage.

Typical Applications (continued)

A. The modulating signal can be direct or capacitively coupled to CONT. For direct coupling, consider the effects of modulation source voltage and impedance on the bias of the timer.

$R_A = 3\text{ k}\Omega$

$R_B = 309\text{ k}\Omega$

$C = 1\text{ nF}$

Figure 22. Circuit for Pulse-Position Modulation

8.2.3.1 Design Requirements

Both DC- and AC-coupled modulation input changes the upper and lower voltage thresholds for the timing capacitor. Both frequency and duty cycle vary with the modulation voltage. Control voltage below 1 V could result in output glitches instead of a steady output pulse stream

8.2.3.2 Detailed Design Procedure

The nominal output frequency and duty cycle for control voltage set to 2/3 of  $V_{DD}$  can be determined using formulas in *Stable Operation* section.

8.2.3.3 Application Curves

## Typical Applications (continued)

### 8.2.4 Sequential Timer

Many applications, such as computers, require signals for initializing conditions during start-up. Other applications, such as test equipment, require activation of test signals in sequence. These timing circuits can be connected to provide such sequential control. The timers can be used in various combinations of astable or monostable circuit connections, with or without modulation, for extremely flexible waveform control. Figure 25 shows a sequencer circuit with possible applications in many systems, and Figure 26 shows the output waveforms.

NOTE: S closes momentarily at  $t = 0$ .

Figure 25. Sequential Timer Circuit

#### 8.2.4.1 Design Requirements

The sequential timer application chains together multiple monostable timers. The joining components are the 33-kΩ resistors and 0.001-μF capacitors. The output high to low edge passes a 10-μs start pulse to the next monostable. A diode is needed to prevent over voltage on the trigger input when on the previous output's low to high edge.

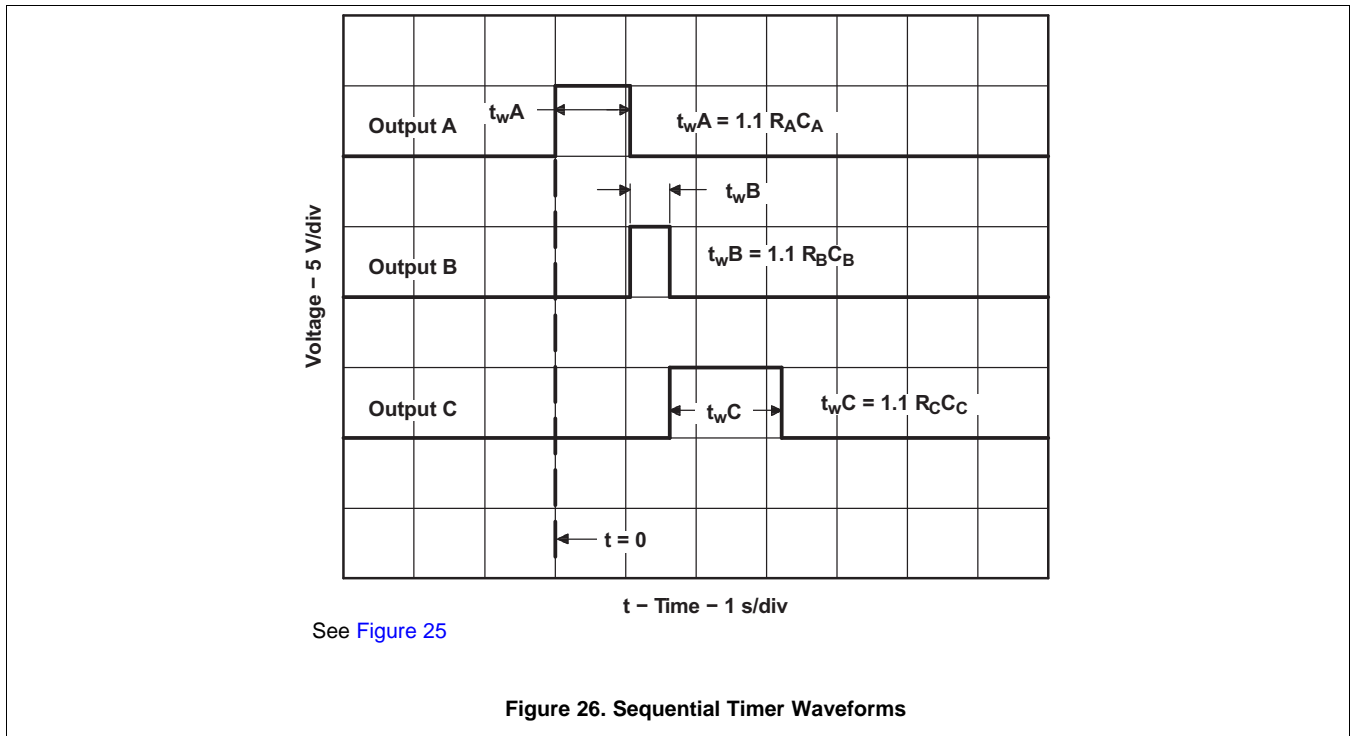

#### 8.2.4.2 Detailed Design Procedure

The timing resistors and capacitors can be chosen using this formula:  $t_w = 1.1 \times R \times C$ .

Typical Applications (continued)

8.2.4.3 Application Curve

8.2.5 Designing for Improved ESD Performance

The TLC555 internal HBM and CDM protection allows for safe assembly in ESD controlled environments. In applications that may expose pins of the TLC555 to ESD, additional protection is highly recommended. The test board schematic below has bypass capacitors, current-limiting resistors, and voltage clamping TVS diodes to provide additional protection for commonly exposed pins [Reset, Trig, and Output] against ESD.

**Typical Applications (continued)**

The table below gives the ESD protection levels recorded for different supply voltages and external components populated. Using only passive components to protect the TLC555 with a single 15-V supply is not recommended because the higher voltage allows for an unacceptable amount of current to flow through the device.

**Table 2. ESD test result table**

Supply Voltage	Just passive components populated. D1..D7 not populated <sup>(1)</sup>	All components populated <sup>(1)</sup>
5 V	8 kV	12 kV
15 V	Not recommended	12 kV

(1) Sample results. Results may vary with populated components, board layout, and samples used.

**9 Power Supply Recommendations**

The TLC555 requires a voltage supply greater than or equal to 2 V, 3 V, or 5 V based the coldest ambient temperature supported and a supply voltage less than or equal to 15 V. Adequate power supply bypassing is necessary to protect associated circuitry and provide stable output pulses. Minimum recommended is 0.1-μF ceramic in parallel with 1-μF electrolytic. Place the bypass capacitors as close as possible to the TLC555 and minimize the trace length.

## 10 Layout

### 10.1 Layout Guidelines

Standard PCB rules apply to routing the TLC555. The 0.1- $\mu\text{F}$  ceramic capacitor in parallel with a 1- $\mu\text{F}$  electrolytic capacitor must be as close as possible to the TLC555. The capacitor used for the time delay must also be placed as close to the discharge pin. A ground plane on the bottom layer can be used to provide better noise immunity and signal integrity.

Figure 28 is the basic layout for various applications.

- C1—based on time delay calculations
- C2—0.01- $\mu\text{F}$  bypass capacitor for control voltage pin
- C3—0.1- $\mu\text{F}$  bypass ceramic capacitor
- C4—1- $\mu\text{F}$  electrolytic bypass capacitor
- R1—based on time-delay calculations

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of  $\leq 1000$ ppm threshold. Antimony trioxide based flame retardants must also meet the  $\leq 1000$ ppm threshold requirement.

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PW (R-PDSO-G14)

PLASTIC SMALL OUTLINE

4040064-3/G 02/11

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
  - D. Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
  - E. Falls within JEDEC MO-153

PW (R-PDSO-G14)

PLASTIC SMALL OUTLINE

4211284-2/G 08/15

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
  - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

D0008A

# PACKAGE OUTLINE

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

4214825/C 02/2019

NOTES:

- Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
- This drawing is subject to change without notice.
- This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
- This dimension does not include interlead flash.
- Reference JEDEC registration MS-012, variation AA.

# EXAMPLE BOARD LAYOUT

D0008A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

LAND PATTERN EXAMPLE  
 EXPOSED METAL SHOWN  
 SCALE:8X

SOLDER MASK DETAILS

4214825/C 02/2019

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

# EXAMPLE STENCIL DESIGN

D0008A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

SOLDER PASTE EXAMPLE  
BASED ON .005 INCH [0.125 MM] THICK STENCIL  
SCALE:8X

4214825/C 02/2019

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

MECHANICAL DATA

PS (R-PDSO-G8)

PLASTIC SMALL-OUTLINE PACKAGE

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Body dimensions do not include mold flash or protrusion, not to exceed 0,15.

PS (R-PDSO-G8)

PLASTIC SMALL OUTLINE

4212188/A 09/11

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Publication IPC-7351 is recommended for alternate designs.
  - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
  - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

P (R-PDIP-T8)

PLASTIC DUAL-IN-LINE PACKAGE

- NOTES:
- A. All linear dimensions are in inches (millimeters).
  - B. This drawing is subject to change without notice.
  - C. Falls within JEDEC MS-001 variation BA.
